and management of fixed assets

### TRIUMPH BUSINESS SYSTEMS

So much more than just a system to manage your business' fixed assets, Triumph is a powerful, awarding winning Enterprise Resource Planning (ERP) package.

Specifically developed and designed for Australian businesses, Triumph is a fully integrated package of 30 plus modules that seamlessly link together to manage all the information and business processes across your organisation.

And as your business develops and grows, Triumph offers an unparalleled ability to easily add on modules and users, making it the most capable entry level ERP package on the market today.

Triumph – incredibly powerful and incredible value for money.

Every business should know at all times what assets they own, who is using them, their condition and where the assets are located. There are potential financial consequences in not maintaining an accurate register of assets including theft and misappropriation as well as forgoing major tax benefits.

However, monitoring fixed assets, and their correct value including depreciation, can be a painful process. Triumph's Fixed Assets module makes it simple and effortless to keep track of all details of your fixed assets and is an essential management tool for all businesses, large and small.

The Fixed Assets module is much more than just a simple inventory. Complimenting your General Ledger, it also provides comprehensive information on asset costs, accumulated depreciation and proceeds from the sale of assets, amongst other useful reporting data.

Designed with ease of use and functionality at its core, photographic images of each asset allow for instant visual recognition. As well as basic information such as serial numbers, supplier and insurance and finance details, user defined fields allow for a myriad of additional information to be stored. A complete transaction audit is maintained for each asset including additions, transfers, depreciation, revaluations and disposals.

And Triumph's Fixed Assets can be run as a stand-alone module, be integrated with the General Ledger module or interfaced with other external accounting systems.
